SIZE GUIDE

It is essential to measure your dog's chest circumference accurately to avoid a vest that is too big or too small, which could cause irritation or injury.

For all models, select the vest size by measuring A, the widest part of your dog's ribcage.

To ensure the best fit, simply measure your dog's chest circumference. The neck and belly can be adjusted later using the Velcro straps.

It is crucial to take this measurement precisely. We recommend using a flexible measuring tape or a piece of string to determine the exact size. The measurement should never be too tight—it should just lightly touch the fur.

For example, if you measure a chest circumference of 62 cm, we recommend a T65 size. Based on experience, measurements are often taken too tightly or too far back on the dog, which distorts the results and reduces the actual chest circumference.

However, we strongly advise against choosing a vest that is one or two sizes too big, as an oversized vest could cause injuries around the dog's legs.

How to put the vest on your dog

For the best fit, it is recommended to equip the vest while your dog is arched on its hind legs. This prevents the dog from rounding its back and makes the closure system much easier to secure.

- First, guide your dog's front legs through the vest openings.
- Then, secure the collar strap that runs through the vest loops around the neck.
- Finally, close the zippers on both sides of the dog's back to adjust the vest for a snug fit.

A vest that is too large can cause injuries and physical discomfort for your dog.
